User Test Report

Mochi – Time Management Web Application

Module	M4: Data & Information
Project	Mochi (Proposal 5)
Team	Manuel Abril Lopez, Mateus Guimaraes Pedro, Vladimir Simov, Ondrej Pazourek, Pranay Ghelani, Rebeka Olar
Sprint	Sprint 1 – Design Review
Date	May 2026
Reviewer	Imam Ramadan (RISE project team)

1. Introduction

This report documents feedback collected during Sprint 1 of the Mochi project. At this stage, the team had not yet produced a working or interactive prototype. What was shared for review was a set of static screen designs, presented as visual mockups to illustrate the intended look and layout of the application.

The purpose of the review was to gather early impressions on the design direction – specifically the visual style, layout choices, and general feel of the interface – before development begins. No functionality was tested, and no user flows were walked through.

2. What Was Reviewed

The following screens were shared as static design images:

- Authentication page
- Home page
- Calendar page
- Goals page
- Ideal Day page
- Challenges page
- Friends page
- Achievements page
- My Mochi page

The reviewer was asked to look through the designs and comment on the visual appearance, clarity of layout, and overall impression. No tasks were assigned and no interactions were possible at this point.

3. Reviewer Profile

Feedback was provided by one reviewer, a student from the RISE project team also participating in Module 4. The reviewer had no prior involvement with the Mochi project and gave an outside perspective on the designs.

This was a single-person review rather than a formal user test. A wider set of reviewers – ideally students who deal with time management challenges – would provide more representative feedback in later stages when actual functionality can be tested.

4. Findings

4.1 Positive Observations

The following aspects were noted as working well across the designs:

1. Clean visual design – the screens were described as having a clean look overall. Nothing felt visually noisy or overcomplicated, which is important for an app aimed at reducing student stress.
2. Intuitive layout – even without any interaction, the reviewer felt the features were easy to understand from the designs alone. The purpose of each screen came across without needing explanation.
3. Consistent structure – the pages felt coherent with one another. The layouts were well organised and the overall structure gave a good impression of how the app would hold together.
4. Light theme – the choice of a light colour theme was seen as fitting for the type of application and contributed to the clean feel noted above.

4.2 Points for Improvement

Two things were raised as areas to look at:

Home page feels cluttered

The home page design was singled out as having too much going on at once. Compared to the other screens, it tries to show several things at the same time – activity overviews, Mochi status, goals, and streaks – which makes it harder to immediately know where to focus. This was the only screen that received a critical comment.

This is worth addressing in the design before implementation. Options include reducing the number of elements shown by default, grouping related information more clearly, or splitting content across sections so the most relevant part is immediately visible.

Dark mode not present

The reviewer mentioned that a dark mode option would be a nice addition. This is a common expectation in student-facing apps, especially for use in the evening. The current light theme works well on its own, but the lack of an alternative was worth noting.

This is not a priority for the current sprint and should sit in the backlog as a could-have for later.

5. Summary

Positives	To address
– Clean, pleasant look across all screens – Layouts easy to understand at a glance – Consistent design across pages – Light theme fits the app well	– Home page layout is too dense – Dark mode missing (backlog item)

6. Next Steps

Based on the design feedback, the following is planned going into the next sprint:

- Revisit the home page layout before implementation starts. Reduce the number of visible elements or reorganise the hierarchy so the most important content stands out.
- Log dark mode as a could-have in the backlog. To be picked up only after core functionality is in place.
- Once a working version of the application exists, conduct a proper usability test with actual student users who can interact with the system.

Overall, the design review was positive. The visual direction is solid and the screens communicate the concept clearly. The home page density is the main thing to sort out before building it out.
